

ANJALI RAJAWAT

.NET Full-Stack Developer

anjaliirajawat712@gmail.com | +91 90095 54739

PROFESSIONAL SUMMARY

Full-stack .NET developer with around 1.5 years of experience building data-driven enterprise (ERP) web applications using ASP.NET Web Forms (VB.NET), JavaScript and SQL Server. Skilled at designing dynamic, configuration-driven UI modules with DevExtreme grids and forms, writing T-SQL queries, and delivering CRUD, approval-workflow and reporting features end to end. Committed to clean, maintainable code, reusable workflows and backward compatibility within large existing codebases.

TECHNICAL SKILLS

Languages	VB.NET, JavaScript (ES6), T-SQL, HTML5, CSS3
Web / Backend	ASP.NET Web Forms (.NET Framework 4.8), ASMX Web Services, AJAX, REST-style endpoints
Front-End	jQuery, DevExtreme (dxDataGrid, dxSelectBox, dxButton, dxDateBox), Bootstrap 5, responsive UI
Database	SQL Server / LocalDB — schema design, joins, query optimization, stored-procedure integration
Tools	Visual Studio 2022, IIS Express, Git, PowerShell, Excel automation
Concepts	CRUD & approval workflows, modal/grid-driven forms, role-based visibility, data validation

EXPERIENCE

Software Developer — Indus Analytics	Nov 2024 – Present
ERP Web Application — Manufacturing / Printing Domain	
- Designed and delivered end-to-end ERP modules in ASP.NET Web Forms (VB.NET) used daily by inventory, purchase and production teams, owning the full cycle from UI and database design to web-service integration and testing. - Engineered a configuration-driven form engine that renders the correct fields, validations and item-name templates per product group from metadata — eliminating dozens of hard-coded screens and making new item categories addable without code changes. - Re-architected duplicated Item and Spare-part flows into one reusable, flag-driven workflow, cutting redundant grids, modals and save logic roughly in half while keeping every existing validation and backend behavior fully backward-compatible. - Built a role-based access layer so requests are visible to their creator and reporting HOD through the User-Master employee-allocation mapping, and added in-grid one-click "Send for Approval" actions — streamlining the approval cycle for end users. - Developed master modules including AMC, Capex and HSN/GST management with dependent Production-Unit → Department dropdowns and auto-filled tax data, all wired to SQL Server through ASMX web services with clean, parameterized data flows.	

- Wrote and optimized complex T-SQL (multi-table joins, EXISTS-based filters, bulk data verification) and validated item-name/HSN data integrity across hundreds of records.
- Improved usability across screens — department-wise bulk approver allocation, consistent action buttons and responsive DevExtreme grids — based on direct user feedback, reducing repetitive manual steps.

KEY PROJECTS

- **Inventory & New Item-Request Module:** Group-aware item creation with live duplicate/similar checks, HSN-driven auto-filled GST, dynamic validation and single-click approval posting.
- **Spare & AMC Management:** Unified spare-part request workflow and full AMC lifecycle with machine allocation, production-unit/department mapping and reference linkage.
- **Approval & Access Control:** Configurable multi-level user-approval settings with department-wise bulk allocation and HOD-based request visibility.
